

Maintenance

Have you ever wondered what elements make the production process effective? Who is responsible for reconciling the production plan with the necessary maintenance, repairs or improvements, and who reacts when a failure occurs at the least appropriate moment? This is the huge responsibility of Maintenance Team consisting of technicians, automaticians, electricians and engineers! It is the maintenance that helps the factory to maintain resources while controlling time and costs to ensure maximum efficiency of the production process, utilities and related equipment and machinery.

Maintenance at L'Oréal

At L'Oréal Warsaw Plant our team takes care of 320 devices and production machines! We use six 3D printers to design and print machine components and spare parts for the factory. We cooperate with the world's top suppliers using the most modern solutions. Like automation and robotics.

Being a part of maintenance team means making sure that our 24/7 working factory is able to meet the growing market demand, alongside with top class specialists of wide technical knowledge and experience.

#Personally about maintenance

The importance of the maintenance department is growing and in the following years this trend will be even more visible as the consumer trends, demand for agility will be even higher. The dynamics of changes, new technologies and digital tools need continuous development.

As in production industry there are no days alike, I always say that this is a role for people with passion who like to face daily challenges and are actively looking for new solutions. Work in the maintenance department requires commitment and continuous improvement of own qualifications. We have to stay open to new technologies but also be able to share the knowledge with others.
